$playlist_genrerock$	-0.028	0.083	-0.339	0.735

Exercise 3

```
## number of observations
n <- nrow(spotify)

backward_bic <- step(full_model, direction="backward", k=log(n), results = "hide")

tidy(backward_bic)%>%
   kable(digits=3)
```

term	estimate	std.error	statistic	p.value
(Intercept)	-0.413	0.063	-6.514	0
danceability	0.643	0.063	10.283	0
energy	0.697	0.057	12.173	0

term	estimate	std.error	statistic	p.value
acousticness	0.146	0.041	3.574	0

Exercise 4

The models do not have the same number of predictors. The model using AIC has all of the same predictors as the model using BIC plus an additional five predictor variables.

This is the model we would expect to have more predictors because for data with more than eight observations, like the spotify data which has 508 observations, the penalty for BIC is larger than that of AIC. This means that BIC tends to favor more parsimonious models (i.e. models with fewer terms). Therefore, we would expect the model using BIC to have fewer predictors, and this is in fact the case.

Exercise 5

Step: AIC=-1716.24

```
forward_aic <- step(int_only_model, formula(full_model), direction = "forward", results = "hide")
## Start: AIC=-1518.87
